Informe de Análisis Automatizado

- Se identificaron 3 grupos principales mediante K-Means:

- Alta rotación: 1804 registros

- Detección de valores atípicos:

- Por Z-score: 35 valores atípicos

- Por IQR: 354 valores atípicos

- Por Isolation Forest: 220 registros marcados como anómalos

- Correlaciones fuertes detectadas (|r| >= 0.80):

- Price vs Revenue: r = 0.98

Sugerencias basadas en detección de atípicos:

- El método IQR detectó muchos extremos. Podría haber errores de captura o valores no

representativos.

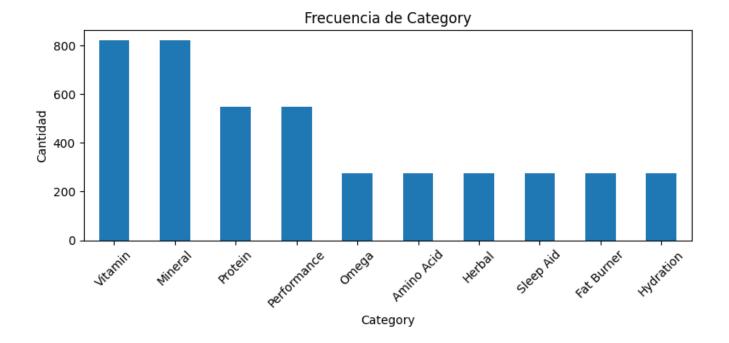

- Isolation Forest detectó anomalías en múltiples registros. Considera revisarlos individualmente.

Sugerencias basadas en correlaciones fuertes:

- Se detectaron variables con alta correlación. Podrías eliminar una de las dos para evitar

redundancia:

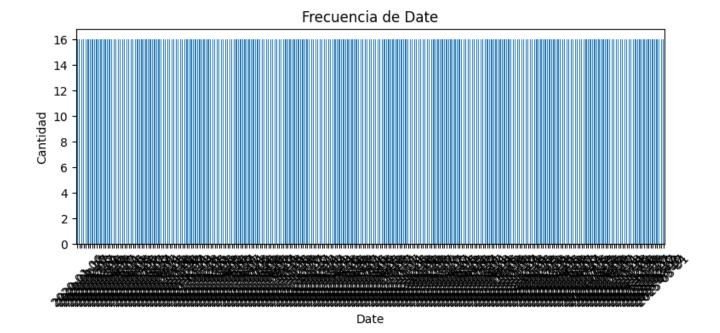

Price y Revenue: r = 0.98
